

Java path setting

The information on this page refers to License Statistics v6.14 or newer, which introduced Java settings.

The xflcstat.cfg configuration file includes a section labeled "Java" with JAVA_PATH property, which lets you specify a custom path to the Java JDK/JRE. For Linux or Windows, these settings are found under the "Other" settings of the [License Statistics Manager Configuration Settings](#).

By default, the Java JDK/JRE path is set to the location of the Java JDK/JRE that is delivered with the License Statistics installation. See [Java licensing policy](#) for details on X-Formation's current policies on Java licensing.
