

Upgrading the license server

You must upgrade your LM-X License Server every time your software vendor upgrades to a new LM-X release.

To upgrade the server at your site:

1. Uninstall and remove the old [LM-X License Server](#).
2. Install the new license server obtained from your software vendor.

After upgrading LM-X to a newer version, your existing application and existing license files should continue to work with the new version, as described in [Version compatibility](#).
