Defining general template settings

You define the general settings for a template using the General tab of the Template dialog. General settings include:

Field	Description
Template Name	A descriptive name that identifies the template.
License File Name	The name to give the license file. The name defaults to license_%TIME%.lic, where %TIME% is a variable that indicates when the license is activated, using the format YYYY_MM_DD-hh_mm. For example: "license_2012_11_28-18_30.lic." You can replace this default with a custom file name (for example, "mylicense.txt"). You can use the %TIME% variable, which is case-insensitive, one or more times; for example, "%time%_mylicense_%TIME%.lic" will result in a file name like "2012_11_28-18_30_mylicense_2012_11_28-18_30.lic."
License Type	The type of license (Network or Local).
Licensee Type	The type of entity that the license will be created for (Fixed, Customer, Unspecified).
Licensee	The name of the person, company, etc. that will be receiving the license. (Optional.)
Activations Allowed	The number of concurrent licenses that can be activated under the license order.
Deactivations Allowed	The maximum number of end-user license deactivations that are allowed using the SOAP API.
Description	A description of the license order. (Optional.)
