

Adding and editing license server aliases

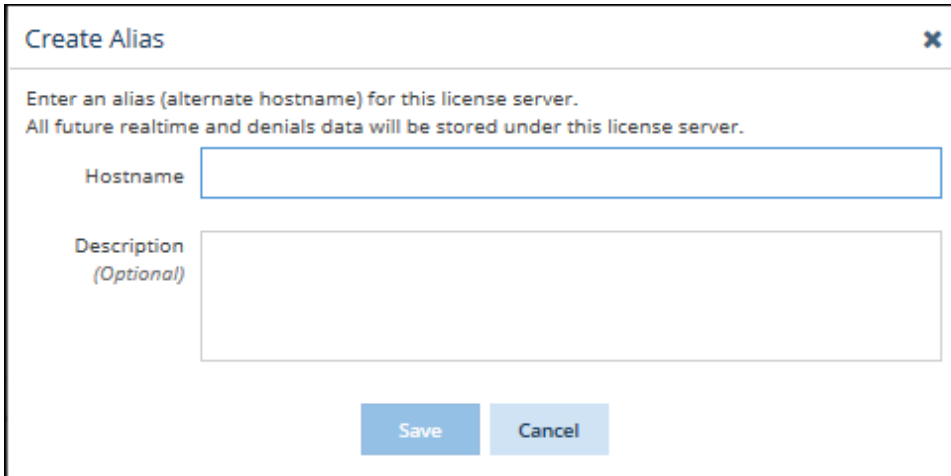

This page refers to functionality that has been removed from License Statistics. License Statistics v6.11 removed license server alias and merge functionality.

Assigning an alias helps License Statistics access data located in the same place by using different symbolic names. (Note that an alias will not be displayed as a separate license server.)

To assign a server alias for a server that uses multiple hostnames (one for realtime data and another for denials data), so that all **future data** in License Statistics will be shown under one server:

1. In the Settings tab of the [License Servers page under the Administration area](#), select the realtime server to which you want to assign an alias.
2. Click the **Edit** icon in the Action column to open the Edit License Server dialog.
3. Under the **Aliases** tab, click **Add** to add an alias for the license server you are currently editing.

The image shows a 'Create Alias' dialog box with a close button (X) in the top right corner. Inside the dialog, there is a text prompt: 'Enter an alias (alternate hostname) for this license server. All future realtime and denials data will be stored under this license server.' Below this prompt are two input fields. The first is labeled 'Hostname' and is a single-line text box. The second is labeled 'Description (Optional)' and is a multi-line text box. At the bottom of the dialog, there are two buttons: 'Save' and 'Cancel'.

4. Enter the hostname that is being used for the denials log in the "Hostname" field.
5. Optionally, enter a description for the alias in the "Description" field.
6. Click **Save** to create the alias.
7. You can edit or delete the alias information at any time by editing the license server and using the Edit and Delete icons under the Action column in the **Aliases** tab.
