

Exceptions

- Token-based licenses cannot use [borrowing](#) or incremental checkin (see [LMX_Checkin](#)).
- Aside from specifying a dependency list instead of a count, a token-based license is identical to a normal network license. Therefore, token-based licenses can be locked with a HostID. However, to provide ease of use when users want to move licenses, we recommend that you do not lock token-based licenses using a HostID.
- [Token-based](#) licenses cannot be checked out using [dynamic reservations](#), because token-based licenses are always additive.
