Exceptions

- Token-based licenses cannot use borrowing or incremental checkin (see LMX_Checkin).
 Aside from specifying a dependency list instead of a count, a token-based license is identical to a normal network license. Therefore, token-based licenses can be locked with a HostID. However, to provide ease of use when users want to move licenses, we recommend that you do not lock token-based licenses using a HostID.
- Token-based licenses cannot be checked out using dynamic reservations, because token-based licenses are always additive.
