

LMX_AtExit

The information on this page refers to versions prior to 4.6, which removed the LMX_AtExit function.

The LMX_AtExit function registers functions that are to be called at program termination.

Prototype

```
LMX_STATUS LMX_AtExit
(
    AtExit_pfn Func
);
```

Parameters

Func

[in] Function to be called at cleanup.

Return values

On success, this function returns the status code LMX_SUCCESS.

On failure, this function returns an error code in the format described in [Return codes](#).

Remarks

LMX_AtExit is used to register cleanup functions that access the LM-X API.

Note: Cstdlib's atexit(), WinApi's _onexit(), and static object destructors are not supported and will result in undefined behavior.
