Removing license servers

Only License Statistics administrators can remove license servers. The options for removing license servers are not available to non-administrative users.

To remove a license server from the list of servers being monitored by License Statistics:

1. Go to the License Servers page in the Administration section. (This page lists both realtime and imported license servers.)
2. Click the **Delete** icon in the Action column in the row of the license server you want to remove.
3. Click **Yes** from the confirmation dialog to delete the license server. The license and all data for that license server is removed.

Note that removing license servers is an asynchronous process. Deleting large sets of data or overcoming limitations of architecture performance (for example, resulting from hardware setup) may cause the license server removal to take longer than usual. Any errors that occur when removing license servers are listed in the Event Log grid.

Caution: When you remove a license server from License Statistics, all the license usage data for that server is removed from the database. If you do not want to remove the data, you may want to hide the server instead, as described in Visibility settings.
