

Custom report utility

This page refers to functionality that has been removed from License Statistics.

The custom report utility, `xfcustomreport`, lets you generate reports by querying the License Statistics database for the data you want to gather. The custom report utility generates HTML files that can be viewed in a browser and CSV files that can be opened in Microsoft Excel. This utility works for both Windows and Linux.

The custom report utility is an executable you run from a command line, and does not require any further configuration. The custom report utility executable exists in the License Statistics directory. You should add the location of the executable to your PATH environment variable, so you can run the command from any directory to which you want to output the custom reports.

See [Using the custom report utility](#) for information about using the custom report utility.
