

# Database edit utility

*This page refers to functionality that has been removed from License Statistics.*

The License Statistics database edit utility, `xfeditdb`, lets you work with data in License Statistics databases, including merging databases and renaming features. You can also view, add, and delete user and host groups and members within groups.

The License Statistics database edit utility is an executable you run from a command line, and does not require any further configuration. The executable exists in the License Statistics directory. You should add the location of the executable to your PATH environment variable, so you can run the commands from any directory to which you want to output the databases.

See [Working with License Statistics database data using `xfeditdb`](#) for information about using the database edit utility.
