Using the License Statistics UI

The information on this page refers to License Statistics v6.0 and newer, which introduced a new user interface (UI). If you are using a version previous to v6.0, see documentation for previous versions.

All License Statistics data for all monitored applications is accessed from an easy-to-use web interface that authorized users can access from their computer or web-enabled device (tablet or phone) over an intranet, making it easy to share license tracking information throughout your site. For information about the system requirements for running the License Statistics user interface, see System requirements for UIs.

The License Statistics UI gives you access to information on license server activity, feature usage, user activity, custom SQL queries, and Denied Requests Log statistics (extracted from a FLEXlm/FlexNet or Reprise License Manager (RLM) debug log file or an IBM LUM server, which requires configuration as described in Denied Requests Log).

License Statistics administration functions, including user administration, removal of license servers from monitoring, and the ability to show or hide selected license server and feature information in the pages, are also accessed using the UI.

The data shown in the License Statistics grids and charts is automatically updated.

The following sections describe how to use the License Statistics application.
