

Enabling LDAP over SSL

The information on this page refers to License Statistics v6.0 and newer, which introduced a new user interface (UI).

If you have [set up an LDAP connection](#), you may want to enable LDAP over SSL. By default, LDAP traffic is transmitted unsecured. You can, however, make LDAP traffic confidential by installing a valid certificate issued by a certificate authority (CA). The CA certificate, which contains a public key and the identity of the owner, is needed to enable encrypted communication between License Statistics and your LDAP server.

To connect over SSL please follow the [Enabling LDAP SSL](#) configuration section.
