## **Enabling LDAP over SSL**

The information on this page refers to License Statistics v6.0 and newer, which introduced a new user interface (UI).

If you have set up an LDAP connection, you may want to enable LDAP over SSL. By default, LDAP traffic is transmitted unsecured. You can, however, make LDAP traffic confidential by installing a valid certificate issued by a certificate authority (CA). The CA certificate, which contains a public key and the identity of the owner, is needed to enable encrypted communication between License Statistics and your LDAP server.

To connect over SSL please follow the Enabling LDAP SSL configuration section.
