

Measuring current license usage

The information on this page refers to License Statistics 6.11 and newer, which added a Host IP column. If you are using a version previous to v6.11, see [documentation for previous versions](#).

In addition to daily, weekly, monthly, quarterly, or yearly statistics, License Statistics lets you see the [current usage information](#) for each user, giving you detailed information that you and your management may need to make budgeting and other decisions. The information shown by the Current Users report includes the host (and Host IP, hidden by default) on which the [feature](#) is checked out, details of the features used, the number of licenses in use, checkout time(s), and which license servers the features are running on.

The Current Users report also consists of the Current Users with Highest License Usage bar chart that shows not more than 10 currently active users that are using the highest number of licenses, as shown below.

 As of License Statistics v6.4.1 [visibility settings](#) are applied to the Highest License Usage chart, so usage of hidden Features and/or License Servers is excluded.
