Using the command-line report utility

⚠ *This page refers to functionality that has been removed from License Statistics. The licstatreport utility is no longer supported as of License Statistics v4.10.*

In addition to the report features found in the License Statistics web application, License Statistics includes a command-line report utility, licstatreport, that lets you download reports as CSV files without using a web browser. This utility works for both Windows (licstatreport.exe) and Linux (licstatreport).

The licstatreport utility lets you generate data for realtime servers only. Therefore, if your installation of License Statistics supports gathering both realtime and imported data, only the realtime data can be downloaded using the licstatreport utility. Supported license managers include LM-X, FlexNet, Sentinel RMS, IBM LUM, Custom, RLM, BETA LM, LICMAN, LS-Dyna, Dassault, GNS, and MathLM.

To download a report, you must specify parameters that retrieve specific data from the server. There is a common set of parameters for downloading reports, plus parameters that are specific to the particular reports being downloaded, including:

- Usage Per Feature
- Usage Per User

Note: If a parameter value has spaces in it, it should be enclosed in quotes (for example, "IBM LUM").
